

Start Using a Password Manager

A strong, unique password for every account, without memorizing a single one.

*We Make
I.T.
Happen!*

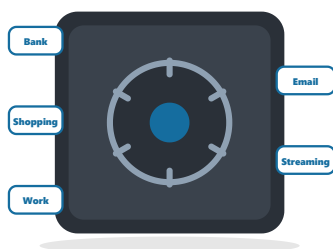

1 Stop Reusing Passwords

When one site is breached, criminals try that password on your **email, bank and shopping** accounts.

2 Pick a Password Manager

Apple Passwords, Google Password Manager, Microsoft Edge (free), or Bitwarden / 1Password.

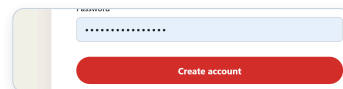

3 Use a Suggested Password

Creating an account? Click the password box, then **Use suggested password**.

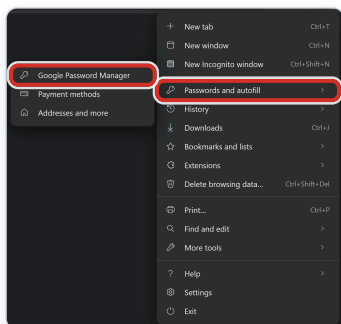

4 It's Saved for You

Chrome saves it in **Google Password Manager**. You never type or remember it.

5 Open Password Manager

Chrome menu : → **Passwords and autofill** → **Google Password Manager**.

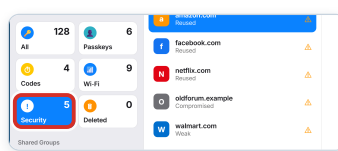

6 Run a Checkup

Click **Checkup**. Change **compromised** passwords first, then reused and weak ones.

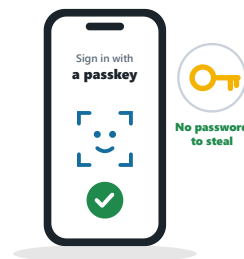

7 Mac & iPhone: Passwords App

Open the **Passwords** app → **Security** → select one → **Change Password on Website**.

8 Say Yes to Passkeys

When a site offers a **passkey**, say yes: sign in with your face or fingerprint, nothing to steal.

Good to Know

- Use a long **master passphrase** (4+ random words) and turn on **two-factor authentication**.
- Save your **recovery key** somewhere safe at home. No password notebooks by the computer.
- **Businesses**: shared vaults (e.g. Bitwarden Teams, 1Password Business) let you remove access in one click.
