How to Connect an iPhone or Android Phone to Wi-Fi

This guide shows how to connect an iPhone or Android phone to a Wi-Fi network: find the setting, tap your network, enter the password, and confirm you're connected.

Why connect to Wi-Fi?

- ☐ Faster, and off your data plan
Streaming, video calls, and big downloads use a lot less cellular data
- ☐ Better signal indoors
Wi-Fi often reaches further inside your home than cell service
- ☐ Needed for some apps and updates
Many app and software updates only download over Wi-Fi by default

Step by step

IPHONE**1 iPhone: connect to Wi-Fi**

Open Settings, then tap Wi-Fi. Tap the name of your network.

WHAT TO DO

Type the password, then tap Join. A checkmark shows you're connected.

ANDROID

2

Android: connect to Wi-Fi

Open Settings, then tap Network & internet, then Internet.

WHAT TO DO

Tap your network, type the password, then tap Connect.

A few tips

- ☐ Don't know the password?
Check the label on the router itself, or ask whoever set it up
- ☐ Not seeing your network?
Make sure Wi-Fi is turned on, and you're close enough to the router
- ☐ Be careful on public Wi-Fi
Avoid online banking or typing passwords on open networks at a cafe or airport

Recap: connect to Wi-Fi

- ☐ iPhone: Settings, Wi-Fi, tap your network, enter the password
- ☐ Android: Settings, Network & internet, Internet, tap your network
- ☐ Type the password, then Join or Connect
- ☐ A checkmark means you're connected

If your phone won't join a network it used to connect to automatically, try "forgetting" that network in Wi-Fi settings, then rejoining it with the password.

Phone won't connect?
