Is Your Backup Ransomware-Proof?

A connected backup isn't the same thing as a safe one.

We Make I.T. Happen!™

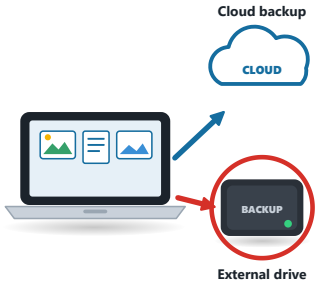

1 "I Sync to the Cloud" Isn't Enough

A live sync can upload the **encrypted version, too**.

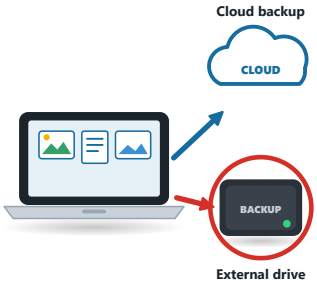

2 Ransomware Looks for Backups

Many variants **delete or encrypt** connected backups.

3 Keep at Least One Copy Offline

Disconnected backups **can't be reached** at all.

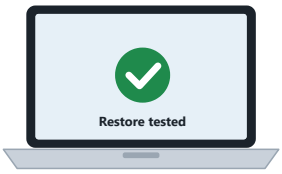

4 Immutable: Can't Be Changed

Not even by a **compromised admin account**.

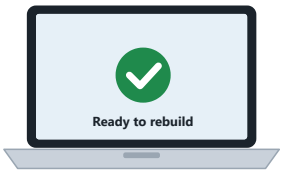

5 Test a Full Restore Regularly

Not just that it ran; that you can **get the data back**.

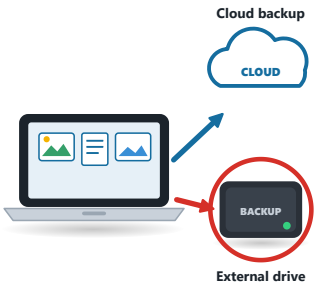

6 Keep "Golden Images" Ready

A rebuildable template gets you running **faster**.

7 Three Copies, Two Kinds of Media

The classic **3-2-1 rule** still applies.

8 One Copy Offline or Immutable

The part that **specifically stops ransomware**.

Good to Know

- One copy offsite, so a fire, flood, or theft can't take out every copy at once.
- Use immutable storage with caution; it doesn't meet every compliance requirement.
- Not sure if yours qualifies? Call **239-513-1960**.
